

## Monoclonal Antibody Therapy Info Sheet

Monoclonal antibody therapy is a treatment option for mild to moderate COVID-19 illness for non-hospitalized people and is a way to prevent the potential progression to severe illness or hospitalization. IDPH continues to encourage Healthcare providers such as primary care offices, outpatient clinics, urgent care centers, infusion centers, dialysis centers, home health services, and hospitals to assess their capabilities to provide this treatment to their patients quickly after they have been identified as having COVID-19 and are determined to be high-risk for severe illness or hospitalization. The two current therapeutics available for use in Illinois are [REGEN-COV](#) and [sotrovimab](#). Sotrovimab is available directly from [GlaxoSmithKline](#). REGEN-COV is available for [ordering](#) from AmeriSourceBergen and is the most commonly used.

There is ample supply available for patient use. The resources and tools located at the websites below can assist healthcare providers in determining their own capabilities to provide this service or finding a location near them that does provide the service or has supply available.

### Routes of Administration

Currently the approved routes of administration under the EUA are via Intravenous Therapy(IV) and Subcutaneous injection (SubQ).

### Post-Exposure Prophylaxis

The REGEN-COV Emergency Use Authorization (EUA) has been expanded to include post-exposure prophylaxis. FDA's authorization of a therapeutic product for post-exposure prophylaxis is a significant advancement in the COVID-19 response that supplements vaccination for disease prevention. Please refer to the [updated Fact Sheets](#) for full details about dosing and administration.

### High Risk Populations

COVID-19 symptoms can vary widely. While others show minimal symptoms, some may see illness progress and experience very serious disease. This risk may increase in people who are older than 12 years of age and who are older and people with serious health problems such as heart or lung conditions, weakened immune systems, obesity, or diabetes. Consideration should be made for any medical condition or other factor, including race or ethnicity, that puts someone at higher risk of progression to severe illness.

Health care providers should assess the need to provide monoclonal antibody therapy access in areas where there is a high concentration of high-risk individuals in their communities.

### Information for Healthcare providers and uninsured patients

The Health Resources and Services Administration (HRSA) has developed an [information resource](#) for patients who do not have health insurance and need services or treatments related to a COVID-19 illness. A federal Uninsured Program pays for COVID-19 services

provided to anyone without health insurance. This is regardless of their immigration status. Testing, treatment, or vaccinations paid for by the federal government will not affect anyone's immigration status or be shared with immigration services. Additional information is available for [healthcare providers](#) and [patients](#).

### Information and Distributive Resources

- IDPH Website: [Monoclonal Antibody Treatment](#) (*update in progress*)
- HHS ASPR's Website: [Monoclonal Antibody Therapeutics](#)
  - This site includes information for infusion sites, healthcare professionals, and patients.
- COMBATCOVID: [Monoclonal Antibodies for High-risk COVID-19 positive patients](#)
- [Centers for Medicare & Medicaid Services](#) – *Medicare Part B Payment for COVID-19 Monoclonal Antibodies during a Public Health Emergency*

### Treatment/Infusion Site Locator Tools

- Healthcare providers and the public can access the links below to determine the infusion site location closest to them. There is also a toll-free number for assistance.
  - Visit the [HHS Protect Infusion Site Locator](#), the [National Infusion Center Association Locator](#)
  - Call the Combat COVID Monoclonal Antibodies Call Center at **1-877-332-6585** for English or **1-877-366-0310** for Spanish

### COVID-19 Monoclonal Antibody Therapeutics Communications Toolkit

- The toolkit linked [here](#) is provided by the U.S. Department of Health and Human Services. The tools include information about monoclonal antibody treatments, product availability, treatment site resources, payment/allocation, and much more.
